

PEPTIDE RETATRUTIDE

Description:

Retatrutide is a tri-agonist peptide that targets three key receptors—GLP-1, GIP, and glucagon—to support metabolism, appetite control, blood sugar regulation, and fat metabolism. By activating all three pathways, it may deliver greater benefits than drugs targeting fewer receptors.

Side Effects:

It is important that you follow the dose and administration instructions as listed. Mild nausea, bloating, or digestive discomfort are common as your body adjusts. Some may experience headaches, fatigue, or injection site irritation. These effects usually improve over time. If any of these symptoms become severe or if your current dose doesn't seem effective, contact us and let the medical team know.

IMPORTANT

1-6 Months
• Until goal weight achieved

AM or PM

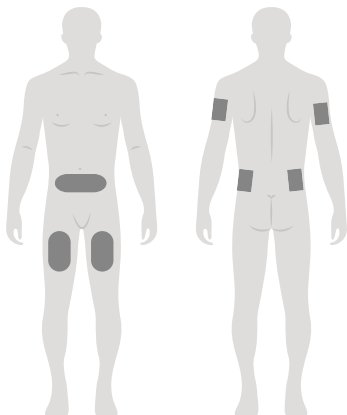

Once per week

See dose note above*

Refrigerate

Injection Site:

Use an alcohol swab on the top of the vial and at the site of injection before use. Work in a clockwise fashion around the belly button to ensure the prior injection sites have healed, avoiding tender areas. Other subcutaneous area shown to the left.
